

Figure 2: Comparison of MAO-A DVs between depressed and healthy subjects. On average MAO-A DVs was elevated by 34 percent, or two standard deviations, in depressed individuals. Differences between groups were highly significant in each region: * $p=0.001$, ** $p<0.0001$, *** $p<0.00001$. The MAO-A DVs is an index of MAO-A density
